

ABSTRACT OF THE DISCLOSURE

A connector assembly incorporating a pressure relief valve is provided for connecting an inflatable article such as an inflatable garment or air mattress to a source of inflation air which presents a low profile during manufacturing and in use. The connector includes a semi-rigid, hollow connector housing having a first, generally tubular, insertable section, insertable through an opening in a flexible wall of the inflatable article. A second external section extends oppositely from the insertable section and outwardly from the flexible wall upon insertion, the external section and the insertable section are connected and oriented generally at an angle, preferably a right angle, with respect to each other.
